

Programming the Fleck 5600 Filter and Softener Controllers for a Well Water Treatment System.

1-There are two controllers, one on the filter and one on the softener. The softener is the unit with a small black hose connected to the salt tank.

2-Notice the dial on the right with the numbers 1 through 12. Those numbers represent days. There is a small metal tab at each number. Slide each one inwards toward the center of the circle. Then rotate each dial until the number 1 is under the red arrow.

3-Set the time of day to the correct time on both units.. Follow the instructions printed o the left side of the control panel. See photo above.

4-On the filter, the unit not using salt, slide out from the center of the circle the metal tabs corresponding to 1, 4, 7, 10.

5-On the softener, slide out from the center of the circle the metal tabs corresponding to 2, 5, 8, 11. This is a good default setting but it may use more salt than required. We recommend you have your water tested and program your softener accordingly.
